written and illustrated by **Dmytro Kuzmenko**
112 pages
paperback
format 200x240 mm

Published: **November 2021**

From the author:

"[...] I must assure you once again that this book will not appeal to anyone. Most of all, it will not appeal to those who love maths because it was written for those who don't. But even the latter will not be happy with this book because it is about the mathematics they so dislike. It won't interest school kids, because they have enough textbooks at school anyway. And teachers quite rightly avoid books not recommended by the Ministry of Education and Science and that have nothing to do with the curriculum. To serious people, the book will seem too frivolous. Yet, for the frivolous there are too many words here that should not be taken lightly."

Did Homer Simpson solve Fermat's Last Theorem? What does romanesco broccoli have to do with the length of the Portuguese border? What's the recipe for the perfect free kick?

#matematyka is an original, humorous book that describes what excites mathematicians. It is interwoven with colourful stories from the mathematical underworld (from antiquity to the present day). The complicated world of mathematics is presented in everyday language, but without the conceited pretence that everything is just so straightforward!

Reading will not be useful for your homework, but it will definitely help you become familiar with the Queen of All Sciences.

- Full of fun facts about mathematics
- Light, funny, even jokey language
- The (Ukrainian) author perversely writes that the book will not be useful when doing homework, which is not entirely true, because it actually delivers a lot of knowledge
- Fun facts, stories and anecdotes from the mathematical "world"
